ORBE - RETRACING EBRO'S PATH

Concentrico 7 - Paseo del Ebro

ORBE GBMV

Construction and afterlife of the installation

The construction of the path and the benches is designed in such a way, that no glue or nails are needed for the assembly of the installation. All the parts, except for the jute covers and ropes are fabricated from the provided Garnica plywood sheet material. In total, 30 sheets of plywood are needed, leaving room for potential extra reinforcements.

The jute bench covers are assembled using the method showed in the drawing on the left. A piece of rope with a wooden 'ornament' is drawn through a hole and rotated to lock in place. The rope can be tightened to provide stiffer seating. The shape of the ornament is based on the towers from the coat of arms of Logroño, and the color follows the facade color of the Casa de las Ciencias. The interlocking of the reinforcement bars between the plywood sheets uses the same principle as the seat covers, but is a stiff connection. The rocking chairs are detached from the bottom structure, but can't move parallel to the path because of this same structure.

After the festival the benches can be disassembled and partly rebuilt as benches in different places. This is possible straight away for the panels that have seat covers in it. To allow the other panels to be transformed into benches too, some extra holes for reinforcement bars and seat covers should be included when the sheets are cut before the festival.
